## Abstract

**Research Question:** Which chemical companies from CEE countries are pioneers in both disclosing SDGs achievements and progressing in fulfilling self-imposed targets?

**Motivation:** Revealing SDGs is unfruitful if it is not supported by relevant indicators to highlight progress against targets (EY, 2017; Schramade, 2017). The strategic importance of the chemical industry, one of the most diversified from all industries, creates sound circumstances for this sector to make known all efforts and contributions towards sustainability engagements (Aga, 2012; Zimara & Eidam, 2015).

**Idea:** Beside financial reporting, currently businesses are encouraged to publish non-financial information to express their awareness about nature and human capital. The chemical industry should consider the SDGs a catalyst for significant business opportunities and a contributor for a better life, across sector and through cooperation with other sectors.

**Data:** In this paper we used a set of panel data extracted from non-financial reports and websites of the 10 largest companies in the chemical industry operating in countries from Central-Eastern Europe: Czech Republic, Hungary, Poland, Romania, and Slovakia. Our analysis covers the period 2015-2019 and addresses the disclosure and progress on reporting SDGs.

**Tools:** To assess the degree of disclosure regarding SDGs and the advancement alongside companies' efforts to comply with UN goals, we carried out a textual and content analysis, then we developed a score, with qualitative and quantitative features, to deliberate the disclosure of SDGs information incorporated in reports.

**Findings:** Our discoveries indicate that 63% of the analysed reports did not clearly mention the SDGs that were targeted by companies' investments. This result noticeably points out that SDGs reporting is presented relatively dissimilar, with reference to structure and extent, among the analysed companies, even though they are part of the same industry.

---

**Contribution:** We consider this paper may be valuable to scholars in their journey considering, assessing and developing original approaches in regard to researches about non-financial reporting, in general, and SDGs, in particular, nevertheless, to businesses to advance in their accomplishments and reporting on the topic of SDGs.

**Keywords:** Sustainable Development Goals (SDGs), chemical industry, Central-Eastern Europe (CEE) economies, score-based approach, content analysis, non-financial reporting, disclosure

**JEL codes:** M14, M21, Q01, Q56

## 1. Introduction

Since the introduction of UN World Commission on Environment and Development Report (WCED), extensive range of initiatives have been conducted at numerous levels in order to tackle the growing number of environmental and social concerns. One forward step towards the encouragement of sustainable development on a global scale was established in 2015 with the creation of the Paris Agreement. This agreement provided a new understanding of the UN Sustainable Development Goals (SDGs). The Paris Agreement has put in place an ambitious itinerary to achieve zero-emission practices in countries and businesses around the world in little more than a generation, based on the World Business Council for Sustainable Development (WBCSD, 2018). In 2015, the UN General Assembly officially approved the 2030 Agenda for Sustainable Development together with a set of 17 Sustainable Development Goals (SDGs) and 169 associated objectives (UN, 2015).

Monitoring and quantifying the impact of Agenda 2030 requires measuring SDGs and sustainable development, which is filled with challenges (Swain and Yang-Wallentin, 2019). Nicolai *et al.* (2015) accentuates the necessity of considerable efforts to be successful with SDGs until 2030. A different point of view is highlighted by Easterly (2015), who argues that the SDGs are underrated goals, exhaustive, where everything is top priority, implying that nothing is a priority.

The Sustainable Development Goals display an inspiring vision of what the world could look like in future. The adoption of these global goals comes at a time when we are daily reminded that the challenges we face – migration, conflict, climate-related disasters, pandemics – cannot be solved by individual countries. Solutions to these imperative issues can only be found in a properly global attempt, with all countries dedicated to accomplishing this bold objective (Nicolai *et al.*, 2015).

However, the model of sustainable development is unfamiliar and new for companies operating in Central-Eastern European (CEE) countries and in some

way, this is considered a targeted development challenge (Raszkowski & Bartniczak, 2019). For countries part of CEE, the post-communist era (1990 upward) has come with many structural ups and downs accompanied with uncertainties; these countries face socio-economic difficulties, as high unemployment rates, high rate of emigration of the population, low purchasing power of households, political hesitations, and the quality of legislation, to name few of them. Essentially, sustainable development is a process of change through which resource exploitation, investment direction, technological development orientation, and institutional changes are harmonically leading to the improvement of the quality of human life, bringing together people, nature and businesses (Nechita, 2019).

Recent publications concerning SDGs reporting pinpoint the lack of clear reporting requirements in the sphere of sustainable development, which complicates the processes of assessing the contribution of economic entities to the achievement of the SDGs (EU, 2019; Kornicieva, 2020).

The focus of the current academic work is on non-financial information disclosed by first 10 largest companies from the chemical industry operating in Czech Republic (CZ), Hungary (HU), Poland (PL), Romania (RO) and Slovakia (SK) in respect to SDGs; the analysis covers period 2015 to 2019. The textual and content analysis of companies' reports reveals the interest of chemical companies in diverse goals and resourceful presentation of information in numerous types of reports. Our research is relevant for the academic community contributing to the contemporary debate concerning SDGs disclosure and progress, as well for businesses to advance in their engagements and reporting on the topic of SDGs.

To achieve our objective, the paper is organized as follows: the literature review section highlights the development of SDGs, progresses concerning the integration of SDGs in reporting by corporations operating in CEE countries and transforming role of accounting in reporting SDG; the methodology details the approaches and procedures used in selecting the data, results and discussion section provides our perceptions in respect to SDGs disclosed by chosen companies. The paper will close with a discussion section, conclusion and future research agenda in this subject.

## **2. Literature review**

In today's complex business landscape, companies are expected to deliver more than profits and shareholder value: they are increasingly focusing on their non-financial performance (Bonini & Swartz, 2014), consequently, the idea of corporate sustainability has become part of mainstream business discourse. To understand the role of sustainability initiatives in business, we looked at academic

studies, investor strategies, and professional organizations surveys on non-financial reporting and SDGs.

## 2.1 Introduction to Sustainable Development Goals – synopsis

The business environment is experiencing profound changes, encouraged by powerful demographic shifts, global economic and societal forces, and emerging technologies. At the same time, society is increasingly demanding companies to become more accountable for their actions, display a greater sense of social responsibility, and embrace more sustainable practices. These trends send a strong signal that what business needs today is much more diverse and different from what it needed yesterday or will need tomorrow. Therefore, a stakeholder approach (Freeman, 1984) is suitable to cope with all demands and expectations.

Since the introduction of UN World Commission on Environment and Development Report, extensive range of initiatives have been conducted at numerous levels in order to tackle the growing number of environmental and social concerns. One forward step towards the encouragement of sustainable development on a global scale was established in 2015 with the creation of the Paris Agreement. This agreement provided a new understanding of the UN Sustainable Development Goals (SDGs). The Paris Agreement has put in place an ambitious itinerary to achieve zero-emission practices in countries and businesses around the world in little more than a generation, based on the World Business Council for Sustainable Development (WBCSD). In 2015, the UN General Assembly officially approved the 2030 Agenda for Sustainable Development together with a set of 17 Sustainable Development Goals (SDGs) and 169 associated objectives (UN, 2015). This framework contains better coverage of, and balance between, the economic, social and environmental dimensions of sustainable development and provides an opportunity to activate systemic change towards a sustainable future (Costanza *et al.*, 2016). A major challenge to advancing sustainable development in the past consisted in the lack of methodologies that facilitate a comprehensive, multidimensional, and dynamic perspective, as well as tools to evaluate the trade-offs and interactions among the economic, social and environmental dimensions of development (Scricciu, 2007).

Sustainable development certainly “means different things to different people” (Aras & Crowther, 2008; Cordova & Celone, 2019). As such, sustainable development has proved a fascinating, but an elusive and abstract paradox (Adelson *et al.*, 2008). Ramirez (2012) has argued that this enigma reflects the tension between the potentially positive effects of economic growth on poverty and employment with the damaging impact of such growth on the environment’s natural resources and on traditional societies and ways of life in many parts of the less developed world.

While the professional community is clearly accentuating the need to adopt evidence-based and science-based approaches to SDGs implementation, policymakers face the challenge of simultaneously implementing the SDGs in a coherent and integrated manner. With an increasing number of developed and developing countries turning their attention to implementation of the SDGs, there is a considerable risk that countries will pursue the same “siloed” or “linear” approaches to sustainable development that have met with limited success in the past. Regular systematic reviews of national progress and approaches to implementing the SDGs are therefore desirable to ensure that emerging science and knowledge are effectively informing national practice (Allen *et al.*, 2018; European Parliament, 2019). Inconsistencies in measurement indicators lead Miola and Schiltz (2019) to accentuate that countries can receive substantially different relative evaluations depending on methods used to measure SDGs performance for EU28 zone.

## **2.2 Reporting SDGs in Central Eastern Europe - emphasis on integrating SDGs in non-financial reporting**

Since 2007, Gazdar had anticipated that non-financials are meant to go beyond financial disclosure and provide stakeholders with a deeper, more balanced view of the company. In this midst of a significant restructuring, the non-financial rating landscape is adapting to new challenges: Sustainable Development Goals (SDGs). After an emphasis on assessing investment portfolio in businesses with prominence attention on environment, climate, social aspects, the business communities are progressing towards a new emerging phenomenon: measuring corporate performance based on the SDGs (Fritz, 2018).

The predilection of reporting SDGs is as a non-financial information, under a number of labels, frequently: *Sustainability Report*, *Corporate Responsibility Report*, *Integrated Report*, *CSR Report*, *Non-financial Performance Statement*, for the reason that the multidimensional structure of SDGs is analogous with non-financial reporting, which includes information about economic performance, environmental and social impact, health matters, demonstrating the link between corporate strategy and commitment to a sustainable global economy (EU, 2019).

Following several attempts to increase the relevance, consistency, transparency and comparability of the disclosure of non-financial information by European Union (EU) companies, the European Union decided to make mandatory the disclosure of non-financial information provided by large companies and groups publishing in 2014 the Non-Financial Reporting Directive (Directive 2014/95/EU) (NFR Directive). Accordingly, this Directive represents an important regulatory action towards harmonizing the non-financial reporting practices of all European Member

States and marks the shift in non-financial reporting from a voluntary implementation to one that is mandatory for largest EU companies (La Torre *et al.*, 2018).

The Directive advocates rules about the reporting of non-financial information applicable to the relevant companies beginning on 1<sup>st</sup> January 2017, or during the calendar year 2017. The non-financial statement should contain information necessary to understand the business's growth and development, position and performance, the impact of company's operations on social, environmental and employees, respect for human rights, fight against corruption and bribery, by including: a brief description of the business model of the company; a description of the company's policies and practice in relation to these issues; the outcome of these policies and practice; the key risks related to these issues, and the operation of the company; key non-financial performance indicators refer to the certain business. The impact on non-financial performance appears to be strictly interconnected to financial performance (the 'connectivity' of the six capitals of integrated reporting), as the achievement of the objectives of each dimension favours the achievement of positive results in the others. Consequently, financial objectives must be combined synergistically with socio-environmental objectives (de Nuccio, 2020). In this way, profit becomes the expression of a superior ability to satisfy the expectations of all business partners, which, in turn, generates stakeholder approval, producing trust, cohesion and motivation, increased competitiveness and, from a circular point of view, contributes to improve financial results. The NFI Directive requirements reflect businesses complexity and ensure companies and their stakeholders have the information they need to make more informed decisions. The NFR Directive incorporates the most used frameworks and standards: Global Reporting Initiative (GRI) Standards, the integrated reporting framework (IR), Taskforce on Climate-related Financial Disclosure (TCFD) Recommendations, and Sustainable Development Goals Disclosure (SDGD) (de Nuccio, 2020).

However, research papers focused on non-financial reporting in CEE countries (Estonia, Hungary, Slovakia, Poland, Lithuania, Latvia, Croatia, Slovenia, Czech Republic, Bulgaria, Romania) disclose a gradual improvement and a clearly positive trend for the future (Accountancy Europe, 2020; Ariano & Hategan, 2019; Dumitru *et al.*, 2017; Putter, 2017; Raszkowski & Bartniczak, 2019). The general trend is one of growth (up 3%), but the divergence between Western and Eastern Europe observed in 2015 and 2017 remains. The rate of reporting in Eastern Europe is still relatively low at 65%, despite an increase of 4% since 2015. Eastern European countries may be closing the gap on the rest of the region but are doing so slowly as shown in *Table 1*. Clearly, the impact of the NFR Directive has yet to be fully felt (KPMG, 2017).

**Table 1. Corporate Responsibility reporting rates: Western Europe vs Eastern Europe**

Region	2015	2017
Western Europe	79%	82%
Eastern Europe	61%	65%

(Source: KPMG, 2017)

Many businesses in Eastern Europe are still focused on the financial bottom line rather than the triple bottom line – it is fair to say that a culture of sustainability is yet to properly take hold across the region, as shown in *Table 2*.

**Table 2. Corporate Responsibility reporting rates by countries**

Country	2015	2017	KPMG's remark
Czech Republic	N/A*	N/A*	N/A*
Hungary	84%	77%	Countries with Corporate Responsibility (CR) reporting rate higher than the global average (72%-89%)
Poland	54%	59%	Countries with Corporate Responsibility (CR) reporting rate lower than the global average (less than 72%)
Romania	68%	74%	Countries with Corporate Responsibility (CR) reporting rate higher than the global average (72%-89%)
Slovakia	48%	55%	Countries with Corporate Responsibility (CR) reporting rate lower than the global average (less than 72%)

\*Czech Republic is not included in KPMG's analysis

(Source: KPMG, 2017)

An informative non-financial report should include both positive and negative impact on the surroundings where the company is based, the company's environmental and social data, and the relationship to sustainable development.

Subsequently the fall or the decline of their non-democratic regimes, the economies of countries in Central and Eastern Europe (CEE) have significantly advanced, and improved reporting by companies is required and supported by international and regional organizations, as well as driven more or less successfully by local bodies (Albu *et al.*, 2016).

For corporations operating in countries from CEE region, academic research papers highlight the reduced quality of non-financial reporting: Guse *et al.* (2016)'s research is revealing that a limited number of Romanian companies reports key performance indicators (KPIs) for non-financial disclosures and Turturea (2016) is

ascertaining the concerns of Romanian listed companies about environmental and social disclosures in their reporting practices during 2001-2014, but limited to philanthropic activities; Kasparova (2018) and Sedlacek (2020) analysed the reports of corporations from Czech Republic and concluded that in their reports, the non-financial information is very general and narrative and indicators such as the environmental impact of business, respect for human rights, philanthropy or anti-corruption rules and transparency were reported by only 43% of the 100 largest listed corporations; Matuszak and Razanska (2017) are noticing that Polish-listed companies are especially interested in reporting their environmental issues and still have a considerable amount of work to do in order to improve the level of reporting in the area of human rights, emphasizing the unbalanced reporting among themes of non-financial information. Similar results were obtained by Ienciu *et al.* (2011) when investigating the quality of environmental information voluntarily reported by Romanian listed companies compared with Hungarian companies for the period 2006-2008, concluding that the majority of environmental information provided by the Romanian companies is incomplete and irrelevant.

When discussing the reporting across industries, Dumitru *et al.* (2011) found a significant correlation between the degree of transparency of corporate responsibility disclosure and the industry sector displaying that Romanian companies operating in non-financial business communicate more CSR information as compared to financial services firms, similar with findings of Sedlacek (2020) for Czech manufacturing corporations and Matuszak and Rozanska (2017) and EY (2017) for Polish non-banking corporations.

Companies might mention the SDGs in their reporting, but have not yet developed any targets or KPIs for assessing and communicating their contributions to these goals (Guse *et al.*, 2016; Schramade, 2017), and, as EY (2017) emphasizes, KPIs for the SDGs are still quite rare. Structured and unstructured communications, both online and offline, should disclose how the company intends to measure its contributions to the SDGs and what SDG-related performance goals it is aiming to. Setting goals demonstrates that the corporate is serious about growing business value by meeting global needs and can strengthen relationships with business partners such as customers and suppliers (KPMG, 2020). The *Sustainable Development Goals Disclosure (SDGD) Recommendations* encourage innovation in terms of disclosing performance. Although metrics are an essential part of assessing performance, narrative disclosures will be required to ensure reporting's completeness (Adams, 2020; Adams *et al.*, 2020). Though it may be tempting to choose KPIs from those that happen to be currently available for other sustainability targets, KPIs really need to follow from goals rather than the other way around (Schramade, 2017). At business level, studies piloted by PwC (2018, 2019) suggest that, despite the SDGs being part of global business conversations

and a significant number of companies guaranteeing a commitment to the Goals, there remains a gap between companies' good intentions and their ability to implement the SDGs into actual business strategy.

Generally, companies operating in CEE countries are engaged in non-financial reporting driven by brand reputation, economic consideration, market image and strengthen the relationship with stakeholders (Cetindamar & Husoy, 2007; Joyner & Payne, 2002; Kornieieva, 2020; KPMG,2011), and they register progress in corporate responsibility reporting and practices, making clear the interest in this area highly appreciated by clients, investors, and other stakeholders (Diaconu, 2012; Dyczkowska *et al.*, 2016; EY, 2018; Jindrichovska & Purcărea, 2011, Sedlacek, 2020; Tiron-Tudor *et al.*, 2019; Raszkowski & Bartniczak, 2019). Rosati and Faria (2019) draw attention on fact that organizations located in countries characterized by a greater focus on achieving quick results - *short-term orientation* - (particularly, the case of Hungary, Poland, Romania where the Hofstede's cultural dimension "long term orientation" is very low, less than 50 out of 100 (Hofstede *et al.*, 2010)) might have been more prone to addressing the SDGs in their sustainability reports earlier.

To conclude, although it is encouraging to see more and more companies discussing the SDGs, for most of companies that is as far as it goes, and their management hardly admit that they are still in the exploration phase. They might mention the SDGs in their reporting, but they have not yet developed any targets or KPIs for assessing and communicating their contributions to SDGs (Schramade, 2017) and the presentation of SDGs in non-financial reports is very customized, and, frequently, unstructured and elusive. This communication on social, environmental and economic issues is in a stand-alone report or is part of an annual report, inside or outside of the audited financial statements and/or inside or outside of the management discussion and analysis and it is found in diverse forms of statements as print advertisements, press releases, securities filings, employee newsletters, and corporate websites (Băleanu *et al.*, 2011; Eccles *et al.*, 2012; Eccles & Krzus, 2010; Fasan, 2013; Izzo *et al.*, 2020; Rolland & Bazzoni, 2009; Zeghal & Ahmed, 1990).

### **2.3 Role of accountancy profession in reporting SDGs**

In terms of reporting the SDGs, accountants will play a dynamic role in ensuring data is reliable and communicated effectively so that it can be used to support the disclosure of the SDGs. Better data will be a critical driver of the SDGs, therefore accounting professionals will be the upholders of this data (ACCA, 2017) and they will become notable advisors in the decision-making process. The specific professional skills of accountants – including in governance, risk management and

controlling business analysis, as well as decision support, which involves measuring, reporting and providing assurance on financial and nonfinancial data – will be increasingly in demand as the SDGs gain power (CGMA, 2018). Accountants possess a unique ability to help identify, capture, analyse, and communicate information critical in linking strategy and sustainability activities (Kaplan & Norton, 2004; Epstein & Hanson, 2006).

At this time, the accounting profession cannot disregard non-financial topics: environment social, governance, ethics and the role of accountants on how they can improve the business strategy and performance draw attention of numerous researchers (Ballou *et al.*, 2011; Beattie, 2014; Bebbington, 2007; Bebbington & Larrinaga, 2014; Bebbington & Unerman, 2018; Brunelli & Ranalli, 2020; Burchell *et al.*, 1980; Gray, 2010; Gray & Collison, 2002; Nechita, 2019; Schaltegger *et al.*, 2017). The interest of accountancy profession in contributing to the reporting of holistic performance of corporations is noticeable as Oprisor (2015) emphasizes in his research when investigating the comment on Framework for Integrated Reporting, in respect to the principle-based requirements; assurance; the “business model” and “outcomes” definitions; the six capitals and materiality principle; the implementation perspective for non-profit organizations and public sector entities. Nowadays, the accountants have to reveal how the company's activities influence the level of environmental pollution, usage of non-renewable resources, public security, health and education, civil rights, and many other aspects of social life. Therefore, according to Jaglinska (1984), it is necessary to create a system of internal and external reporting in order to inform all stakeholders about all aspects and results of corporate activity (as cite by Waniak-Michalak, 2016).

According to IFAC (2016) and Gould and Lim (2019), at least 8 from a total of 17 SDGs have direct relation to accounting. The roles of professional accountants in sustainable reporting are: creators of value through development and implementation of strategies, policies, plans, structure and activities of the management and set a course to create sustainable development values (ACCA, 2017; IFAC, 2016; CGMA, 2018; Makarenko & Plastun, 2017); providers of value by preparing high-quality reporting with prospects focus which is the basis of the sustainable development strategy (Fonseca & Carvalho, 2019; IFAC, 2016; Rezaee & Tuo, 2017); keepers of the value by defending natural, social, industrial and financial capital of the company (Bebbington & Unerman, 2018, IFAC, 2016; Haller, 2016; Jindrichovska & Purcărea, 2011); reporters of values by preparing and ensuring high-quality reporting for stakeholders (CGMA, 2018; CGMA, 2018; IFAC, 2016; Makarenko & Plastun, 2017); educators of sustainability values (Albu *et al.*, 2011; Bebbington & Unerman, 2018, Firmansyah, 2019).

In the paper of Ngwakwe (2012) we distinguish a critical examination of sustainable development initiatives in the accounting profession and the ambition for more a pragmatic approach to achieve accounting impact on sustainable development to overcome the contemporary state of sustainability reporting assessed as a weak approximation of triple bottom line. For the new generation of accountant is important to create and develop sustainability competences (Ng *et al.*, 2017) to endorse and uphold an enhanced SDG reporting.

The exploration of academic literature in respect to the disclosure and communication of SDGs by companies illustrates a limited number of research papers regarding the implementation and reporting of the SDGs by businesses operating in CEE countries and the involvements of accountants in improving SDGs reporting. Therefore, the research question of the current investigation is to assess the level of SDG's presence in corporates' reports published by companies operating in chemical industry, geographically located in Czech Republic (CZ), Hungary (HU), Poland (PL), Romania (RO), and Slovakia (SK) covering the period 2015 – 2019, and to establish the companies' advancement in achieving the SDGs reporting.

### **3. Research methodology**

Since 2015, countries around the world have been translating the SDGs into national plans and policies, designing national implementation and monitoring strategies that would help combat the critical environmental, political, and economic challenges our world is facing. *Appendix I* discloses the list of SDGs as established by the UN in 2015. Achieving the sustainable development goals should be a concern for everyone, from civil society to governments and to business. This study aims to provide an assessment of the contribution, as well as to measure the progress made in this direction by chemical sector companies from representative countries geographically located in Central – Eastern Europe.

As previously emphasised, the academic and professional literature is rich in studies dealing with sustainable development. However, to our knowledge, the majority of such studies approach a macroeconomic, country level analysis (McArthur & Rasmussen, 2019; Nechita *et al.*, 2020; OECD, 2019) and there are limited papers that quantify the impact on SDGs by applying a company-level, microeconomic analysis, and particularly focusing on companies from the chemical sector in CEE economies. The paper has several significant contributions. Firstly, it addresses and analyses the influence exerted on all SDGs, while most studies are considering only one or part of the SDGs (Balcerowicz-Szkutnik *et al.*, 2020). Secondly, the study highlights both the SDGs that benefit from substantial efforts and those SDGs which require further attention, the analysis being conducted based on reports and data available on the companies' websites. Thirdly, the paper is

focused on the chemical sector, which plays an important role serving as a supplier of products and services to practically every other industry – from food and clothes to technology. The chemical sector is heterogeneous and complex, one of the most diversified from all industries (Aga, 2012), and thus it interacts with an extensive number of SDGs (WBCSD, 2018).

### **3.1 Selection criteria**

The analysis presented in this article covers the following five representative CEE countries: Czech Republic, Hungary, Poland, Romania, and Slovakia. We analysed the chemical industry because of its key role in maintaining growth and prosperity, and in transition to a sustainable society. The European Chemical sector comprises around 28,000 companies employing more than 1.4 million people and generating 1.1% of European Union (EU) GDP. The biggest customers of European chemicals are the rubber and plastics (14%) and healthcare (11%) sectors, but chemicals are part of products used every day in all areas: from technology in electrical devices, to cars, clothing, building materials and medicines (Cefic Sustainability Report, 2017). *Table 3* shows the influence of the chemical sector in economy for each of the five analysed countries.

**Table 3. Chemical sector influence on a country-level**

<b>Country / GDP 2019</b>	<b>Chemical industry influence</b>
Czech Republic / 246,49 billion USD	Chemical industry plays a key role in the Czech economy, being the second largest manufacturing industry in the Czech Republic, after automotive industry (19,77 billion EUR turnover, 1,851 companies and 129,500 direct employees in 2018).
Hungary / 170,41 billion USD	Hungary’s chemical industry registered a growth rate above the EU chemical industry average. The Hungarian chemical industry accounts for 6% of total manufacturing industry (5,4 billion EUR turnover, 15,039 direct employees in 2018).
Poland / 592,16 billion USD	The chemical industry has a very high position among industrial sectors. The share of chemical industry in the total industry is 17%. The Polish chemical industry is developing dynamically, with a growth rate which is second among the world’s largest economies (62,15 billion USD turnover, 315,000 direct employees, more than 11,000 companies).
Romania / 250 billion USD	Romania’s chemical industry is smaller, but sizable (2,3 billion EUR turnover, 979 companies, 22,500 direct employees in 2016).

<b>Country / GDP 2019</b>	<b>Chemical industry influence</b>
Slovakia / 105,42 billion USD	The Slovak chemical industry has traditionally been one of the largest sectors of the national economy. In 2014, the chemical companies generated almost 12% of the Slovak industry (10,3 billion EUR turnover, 307 companies and 46,143 direct employees in 2018).

---

(Source: <https://data.worldbank.org/>, <https://www.chemlandscape.cefic.org/>)

Using the ISI Emerging Markets Group's EMIS platform database for companies, we selected the first ten companies sorted by operating revenue for each country, because *Top leaders* based methodology is considered a leading practice in SustainAbility (Albu *et al.*, 2013). The strategy for identifying relevant reporting data continued with searching the reports and website information for each company and deciding on inclusion and exclusion criteria for constructing the appropriate database.

The inclusion criteria for this study are:

- focus on all sustainable development goals;
- a five-year period: 2015-2019 – as the SDGs were set by the United Nations General Assembly in 2015;
- all types of reports – non-financial reports such as Sustainability / Social Responsibility / Social Impact Reports or annual reports with non-financial information to the extent that the formers were not available;
- individual or group reporting – the group reporting information was used when the individual reports were not available;
- additional information from companies' websites, if case (when reports were not available or when the information provided on the website covered complementary aspects).

We applied exclusion criteria to ensure a greater quality of research data, namely for:

- non-available / missing information;
- non-English language reports - to avoid biases associated with language.

Subsequently applying the mentioned criteria, from the initial sample consisting of 50 companies (top 10 firms based on their operating revenues for each of the 5 selected countries), only 35 firms were left, adding up to a number of 114 firm-year observations (from 111 reports and 3 observations based on website only). We hand-collected companies' reports and additional information from the firms' websites.

### 3.2 Data collection instruments and procedures

Through the responsible production, use, and management of chemicals, the chemical sector can contribute to achieving the SDGs using innovative products and practices that minimize any adverse aspects while maximizing positive impacts.

In order to assess the extent to which the chemical sector companies engaged in and reported SDG's achievements, we developed and applied a score-based approach using a scale from 0 to 5, taking into account the targets, the efforts and the measurements companies have set and have monitored during the analysed period, as shown in *Table 4* and detailed in *Appendix 2*. A similar scoring methodology was applied by Hummel (2019), Ionaşcu *et al.* (2020), Matuszak and Razanska (2017) and PwC (2018).

**Table 4. SDG Scoring Methodology**

Score	Targets	Measure-ments	Description
0	-	-	No information disclosed in respect to a specific goal / no target to accomplish
1	Tc	-	SDG with qualitative target, but no results measured and reported yet: there is a qualitative ambition for the company (i.e. narrative description about company plans to take action on those targets), but no information about reporting any obtained results on the progress towards the SDG target.
2	Tc + Eq	-	SDG with qualitative target and quantitative efforts invested, but no results measured and reported yet: there is a qualitative ambition for the company (i.e. narrative description about company plans to take action on those targets) and investments were made, but no information about reporting any obtained results on the progress towards the SDG target.
2	Tq	-	SDG with quantitative target, but no results measured and reported yet: there is a quantitative ambition for the company (i.e. company has set quantified measures that it is aiming for in the future), but no information about reporting any obtained results on the progress towards the SDG target.

Where:

Tc	Qualitative target
Tq	Quantitative target
Eq	Quantitative effort invested
Mc	Qualitative measurement of the result
Mq	Quantitative measurement of the result

We considered a distinction between qualitative and quantitative aspects reported by companies. This was necessary because it provides useful information regarding the extent to which the concept of sustainable development is being implemented (Raszkowski & Bartniczka, 2019). Setting quantitative targets and monitoring their

achievements reflect the effective practices that companies have applied in implementing the SDGs.

### 3.3 Analysis methods

We conducted a textual and content analysis of the reports and other information available on the companies' websites in order to assess the score for each sustainable development goal. Similar to Hummel (2019), Khan *et al.* (2018), and Nichita (2018), we screened all accessible reports in full to identify the qualitative and quantitative targets, efforts, or measurements for each SDG. We used the textual analysis (Hummel, 2019; Li, 2010) in order to determine whether the companies address the SDGs in their reports, by applying search queries for the occurrence of key words, such as "sustainable", "sustainability", "SDG". Afterwards, we applied a content analysis (Guthrie & Abeysekera, 2006; Guthrie & Parker, 2006; Khan *et al.*, 2018; Lungu *et al.*, 2011) for the assessment of the score. All team members were involved in the data collection process and at least two members carefully monitored, and cross-validated the information gathered, paying special attention to particular cases in order to ensure the quality, comparability, and reliability of the research.

We assigned a score for each firm-year observation by judging the company's contribution to each SDG, based on the reported information. Therefore, we attributed the score to a sustainable development goal either by allocating it based on targets and actions addressing or influencing that particular SDG, or by considering the clearly specified SDGs in the reports. Moreover, when an SDG was targeted by the firm, we assigned a score to it if at least one indicator addressing that SDG was influenced by the company.

The conducted research was based on the analysis of all the SDGs, nevertheless a deeper analysis was undertaken to reveal the implementation of the 10 + 1 goals that were identified as being priority SDGs for the chemical sector (WBCSD, 2018), as follows:

- SDG 2 Zero hunger;
- SDG 3 Good health and well-being;
- SDG 6 Clean water and sanitation;
- SDG 7 Affordable and clean energy;
- SDG 8 Decent work and economic growth;
- SDG 9 Industry, innovation and infrastructure;
- SDG 11 Sustainable cities and communities;
- SDG 12 Responsible consumption and production;
- SDG 13 Climate action;
- SDG 14 Life below water;

- SDG 17 Partnership for the goals – not specifically identified as a priority goal, but it is included considering the spirit of collaboration that it embodies, and thus interact with the entire SDG agenda.

## **4. Results**

Our research conducted to noteworthy results and will contribute to enhance investigations concerning understanding of the complex interrelationships which influence the ability of companies to create value to stakeholders and to support creation of a better world. Outcomes found in this paper highlight similarities, differences, and nuances in disclosing SDGs by companies operating in chemical sector.

### **4.1 Results and descriptive discussion related to SDGs reporting**

#### *4.1.1 Structure of the sample*

In terms of the sample structure per year, company and country, *Table 5* emphasises an increasing number of reports in the years following the SDGs issuance, starting from a total number of 17 reports in 2015, and continuing with 22 reports in 2016, 25 in 2017 and then 26 in 2018. This positive trend is partially disrupted in 2019, when the number of reports either stagnated or slightly decreased for each country, as well as decreased to a total number of 21 reports overall. The later evolution could also be a consequence of a delay in preparing the reports for 2019, as the publication date for this type of reports might differ from the one of the annual reports. Despite this drawback, the overall number in 2019 is still higher than the one registered for 2015 (by 24%). Hence, developing the SDGs in 2015 positively influenced the companies' interest in sustainability reporting, at least by providing a better understanding on the concept of sustainable development and by drawing an agenda of the following steps to be applied towards building a better world.

Regarding the type of reporting, out of the 114 observations included in the sample, 63% of the analysed reports did not mention the specific SDGs their efforts were targeting. The highest percentage obtained by this category of reports, for which the SDG score was allocated based on the interpretation of the targets, efforts and measurements disclosed, is partially explained by the fact that in 2015 the SDGs have just been released. Therefore, their novelty degree might have represented an impediment in reporting. A number of 32 observations, representing 28% of the sample were based on the SDGs clearly specified in the reports, whereas the remaining 9% (10 observations) consisted in both allocated SDGs and particularly mentioned ones.

**Table 5. Structure of the sample on countries and firm-year observations  
(based on the number of reports)**

Country	2015	2016	2017	2018	2019	Min	Max	Mean	Total
CZ	3	3	4	4	4	3	4	3.6	<b>18</b>
HU	1	2	4	5	3	1	5	3.0	<b>15</b>
PL	4	6	6	6	5	4	6	5.4	<b>27</b>
RO	3	3	5	5	3	3	5	3.8	<b>19</b>
SK	6	8	6	6	6	6	8	6.4	<b>32</b>
<b>Overall number</b>	<b>17</b>	<b>22</b>	<b>25</b>	<b>26</b>	<b>21</b>				<b>111</b>

This structure might be influenced by the reporting framework companies apply in disclosing sustainability issues, as there are at least 230 initiatives on corporate sustainability standards in over 80 sectors of activity worldwide. The commonly used sustainability reporting frameworks being the Global Reporting Initiative (GRI) and the United Nations Global Compact (UNGC) (Nechita, 2019), this also being the case of our sample.

#### 4.1.2 Descriptive statistics

Table 6 comprises descriptive statistics for each SDG identified in reports issued by selected companies and highlights the overall SDGs score for the period 2015-2019, with additional details regarding the average SDG score values shown in Appendix 2.

**Table 6. Descriptive statistics**

SDG	Mean	Standard deviation	Variance	Score	Observations (N)
SDG 1	0.7193	1.3338	1.7789	82	114
SDG 2	0.6491	1.3034	1.6988	74	114
SDG 3	3.0175	1.9186	3.6811	344	114
SDG 4	3.2807	1.4785	2.1860	374	114
SDG 5	2.7105	2.0164	4.0659	309	114
SDG 6	3.6053	1.6489	2.7189	411	114
SDG 7	3.5614	1.5743	2.4785	406	114
SDG 8	4.0526	1.3227	1.7494	462	114
SDG 9	3.2719	1.6036	2.5714	373	114
SDG 10	1.6228	1.7569	3.0866	185	114
SDG 11	2.6754	1.6102	2.5928	305	114
SDG 12	3.7456	1.4803	2.1914	427	114

**Reporting on Sustainable Development Goals. A score-based approach with company-level evidence from Central-Eastern Europe economies**

SDG	Mean	Standard deviation	Variance	Score	Observations (N)
SDG 13	3.7719	1.4019	1.9652	430	114
SDG 14	1.0439	1.6953	2.8742	119	114
SDG 15	1.7719	1.9689	3.8767	202	114
SDG 16	1.1316	1.8120	3.2834	129	114
SDG 17	3.5000	1.5867	2.5177	399	114

As indicated in *Table 6*, the highest overall SDG score was obtained for SDG 8, adding up to a value of 462 out of a maximum of 875, emphasising that companies are mostly concerned about the safety and well-being of their employees, correspondingly considering that most reports highlighted that companies recorded no fatalities or work accidents.

The SDGs running up next are related to climate action (SDG 13) with a score of 430 and responsible consumption and production (SDG 12), with a score of 427, these findings being consistent with our expectations, given the characteristics and specifics of the chemical industry. Therefore, companies prioritize mitigating the impact of their activities on the environment, especially by taking actions in decreasing the gas emissions. Similar interest is shown for waste management and recycling. These two key SDGs are strongly correlated with the firms' investments in innovation and new technologies (SDG 9 scoring a significant level of 373), as well as the companies' engagement in various partnerships with governmental institutions (SDG 17 scoring 399, likewise being situated above the average).

SDG 3 *Good health and well-being* (Score 344), SDG 4 *Quality education* (Score 374), SDG 5 *Gender equality* (Score 309) and SDG 7 *Affordable and clean energy* (Score 406) are other goals that recorded a Score above the mean. This is explained by the companies' involvement in public health actions (many firms reported their employees volunteering in blood donation programs), by providing internships and holding lectures in partnership with local universities, by encouraging women and monitoring the employees structure on gender (including for leadership positions), as well as implementing measures for the decrease of energy consumption or developing innovative technology for the production of renewable energy.

On the other hand, the low-scoring goals are represented by SDG 15 (Score 202), SDG 10 (Score 185) and SDG 16 (Score 129), located below the mean, whereas SDG 14 (Score 119), SDG 1 (Score 82) and SDG 2 (Score 74) are situated at the end of the range. While measures taken for improving life on land and increasing biodiversity, as well as the ones dedicated to reducing inequalities were in some ways expected (although having a smaller impact than others), the companies'

contribution to peace, justice and strong institutions came as a positive surprise, as a significant number of firms reported their involvement in anti-bribery actions.

The standard deviation disclosed in *Table 6* shows no significant variation, observations mostly being spread out in range of the central tendency. SDG 5 registers the highest standard deviation, whereas SDG 2 records the lowest one. This is explained by the fact that the actions reported by firms on gender equality led to either assigning a high score, where this aspect was considered, or the lowest score in the case there was no mention of gender analysis in their reports. In terms of the zero-hunger score, the lowest standard deviation is a result of the high number of observations assigned with a null or close to 0 score for this goal.

#### **4.2 Analysis of the average score by companies and the completion percentage on average**

From the total number of 35 companies included in the sample, 12 companies (34.28%) record an average SDG score situated above the mean of 44.13, as presented in *Appendix 3*. The analysis based on SDGs completion percentage on average revealed several important aspects. On one hand, four companies representing 11% of the analysed sample succeeded to achieve a SDGs completion percentage on average that exceeded 70%, while 5 companies obtained completion percentage score less than 30% (as illustrated in *Table 7*).

**Table 7. SDGs completion as percentage on average and average number of SDGs reported**

<b>Mean</b>	<b>46%</b>	<b>12</b>

Grey colour shows values above the mean

We interpret these findings are not revealing a desirable situation considering that 5 years have already passed since the SDGs were set on global level and companies should have had enough time to manage the SDGs implementing and reporting procedures. On the other hand, it should be noticed that the average for the chemical sector is close to half (46%). Considering the chemical sector completion percentage average, the analysis showed that 18 companies totalling 51% of the sample reported above average information on SDGs targets, efforts, and measurements.

Our results emphasized that there is an extraordinary symmetry for the first and last places in SDGs completion hierarchy, but also for the distribution of companies compared to the chemical sector average. Hence, 50% of the analysed companies

improve their SDGs implementing and reporting procedure to achieve a high level in reporting hierarchy, while the other half should manage SDGs in a better way to ensure a position at least above average.

Findings shows that the chemical sector entities are focusing their efforts on average on 12 of the 17 SDGs (*Table 7*). A cluster of 5 of the companies, consisting in 14.28% of the sample, report on all the 17 SDGs (HENKEL SLOVENSKO, SPOL. S R.O., LINDE GAS A.S., NOVARTIS SLOVAKIA S.R.O., ROMPETROL RAFINARE S.A., and SOPHARMA AD), while other 5 firms are the lowest rankers by reporting only below 8 SDGs (DEZA AS, ENAGRO AS – ENVIEN GROUP, FORTISCHEM AS, HARTMANN - RICO A.S. and SILON S.R.O.). For the latter category, the result is also determined by the fact that information regarding sustainable development was available only briefly on the companies’ websites or there was only 1 published report found containing limited data.

The goals which were most reported on are SDG 12, SDG 13, and SDG 17, which were mentioned by more than 90% of the companies, as shown in *Table 8*. Goals 4, 5, 6, 7 and 8 appeared in 80-90% of the companies, while SDG 3, 9, 10 and 15 were allocated by 60-80% of the companies. The lowest ranks were occupied by SDG 1, SDG 14 and SDG 16 located between 37-40%, respectively SDG 2 reported only by 29% of the companies. The ranking confirms our initial expectations and it is significantly determined by the relation between the chemical sector particularities and the specificity of each SDG. These results are consistent with our previous findings regarding the highest overall and average scores, and similar to the ones obtained by Ionaşcu *et al.* (2020) for the real estate sector.

**Table 8. Frequency of SDGs reported by the companies**

SDG	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17

Frequency (%)	40	29	74	89	80	86	83	89	89	63	77	91	97	37	63	37	94

### 4.3 Analysis of the overall score by companies

The highest score was obtained by LINDE GAS AS, although the company has reported the SDGs in only one year. By achieving this score, the company showed that it has great potential in both SDGs implementing and reporting, but it lacks consistency over the analysed period. There are other 10 companies which also have a single report, but their score did not exceed 43, meaning an implementing degree below 51%. These companies are covering almost 29% of the companies’ sample, but a trend in their reporting of SDGs cannot be established.

**Table 9. SDGs company score by year**

For the remaining companies (with more than 2 reports), we observed as *Table 9* highlights, the followings aspects:

- 3 companies recorded high constant values showing their great interest related to SDGs reporting (HENKEL SLOVENSKO, SPOL. S.R.O., JOHNSON & JOHNSON, S.R.O., NOVARTIS SLOVAKIA S.R.O.);
- 1 company obtained medium constant values (PHOENIX PHARMA ZRT.);
- for 11 companies a growing trend was observed; we assert this is a favourable situation as companies show their interest on improving their actions and reporting information related to SDGs (AZOMURES SA - AMEROPA GROUP, BASF SLOVENSKO SPOL. S R.O., BORSODCHEM ZRT., BORYSZEW S.A, CHINOIN ZRT. (SANOFI GROUP), GRUPA AZOTY GROUP, HANKOOK TIRE MAGYARORSZAG KFT, HARTMANN - RICO A.S., KRKA D.D., MOL PETROLKEMIA ZRT., UNIPETROL GROUP);
- 6 companies have an oscillating trend over the analysed period (COLAS CZ A.S., DE MICLEN A.S. - GSK GROUP, ROMPETROL RAFINARE SA, SOPHARMA AD, TEVA CZECH INDUSTRIES S.R.O., UNIPETROL GROUP);
- only for 4 companies the analysis revealed a decreasing trend (OLTCHIM SA, SLOVNAFT, A.S., ZAKLADY FARMACEUTYCZNE POLPHARMA S.A., ZENTIVA SA).

The last two observations are unfavourable in terms of SDGs reporting and may be explained by changes made in the report format from one year to another.

#### **4.4 Analysis of SDGs score by years**

As shown in *Table 10*, the interest in reporting the SDGs achievements has an increasing trend in the first years from 2015 to 2018, followed by a decrease in the last year for all the sustainable development goals.

**Table 10. SDGs achievement rate over the analysed period**

SDG/Year	2015	2016	2017	2018	2019
SDG 1	2%	2%	3%	4%	3%

SDG 12	11%	15%	16%	18%	15%
SDG 13	12%	14%	16%	18%	15%
SDG 14	3%	4%	4%	5%	5%
SDG 15	4%	7%	6%	9%	9%
SDG 16	4%	4%	4%	6%	5%
SDG 17	10%	13%	16%	16%	15%

The highest value was recorded for SDG 8 with a maximum accomplishment rate of 20% in 2018. This shows the companies concern for the safety of their employees. In many cases companies established quantitative targets to diminish the number of work accidents and measured their efforts as the safe production is crucial to economic growth.

Fairly close high values were obtained for 9 goals related to human health; quality education; clean water, energy, and air; innovation; sustainable communities; responsible consumption and production; and partnerships. As noticeable in *Table 10*, there is a significant gap between the values of the above-mentioned goals and those for SDG 10, 14, 15, and 16. Considering that the chemical sector counts more than 20 million employees worldwide, the chemical manufacturers should have advocated for equality. Furthermore, this sector should be more aware of the marine pollution and biodiversity than any other sector.

The smallest values were recorded for SDGs referring to combating poverty and hunger, although the SDG 2 was set as a priority goal for the chemical sector (WBCSD, 2018).

A deeper analysis was conducted to determine the degree of compliance of the reported SDGs with the goals where the chemical sector can have the greatest impact. To the ten key goals set for the chemical sector and described in the methodology section, SDG 17 may be added as it is recognized that the spirit of partnership and collaboration it embodies is a recurring theme throughout all the

sustainable development goals, resulting in 10 plus 1 priority goals (WBCSD, 2018).

Considering the values obtained for the SGDs, the 10 plus 1 key goals in the chemical sector of the five analysed countries are: SDG 3, SDG 4, SDG 5, SDG 6, SDG 7, SDG 8, SDG 9, SDG 11, SDG 12, and SDG 13 plus SDG 17. As shown in *Table 11*, there is an exact match for 8 plus 1 priority goals, revealing a compliance of almost 82%.

**Table 11. Comparative key goals for the chemical sector**

SDG	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
Key SDG's (WBCSD, 2018)		✓	✓			✓	✓	✓	✓		✓	✓	✓	✓			✓
Key SDG's (Authors' findings)			✓	✓	✓	✓	✓	✓	✓		✓	✓	✓				✓

Significant differences were found for two of the goals – SDG 2 and SDG 14. Although set in the priority list, the goals related to ending hunger and conserving marine biodiversity did not accumulate the expected score. As chemistry is essential to the global food value chain, enabling higher yields, and improved nutrition, the chemical sector companies should be more involved in actions that contribute to sustainable and healthy food supply. Additionally, this sector should collaborate with others in the value chain on aquatic waste issues, improving water quality by reducing pollution and protect marine and coastal ecosystems. By contrast, the analysis revealed other two key goals: SDG 4 and SDG 5. The chemical sector supported the quality of education through investments and scholarships in universities, but especially through technical apprenticeships useful for potential employees to improve their professional skills. Furthermore, we find as remarkable that the companies were concerned by gender equality. The companies from the chemical sector supported the participation of women and were involved in diminishing the gender gap, also by emphasising the number of women occupying executive positions.

## 5. Conclusion

The model of sustainable development is unfamiliar and new for companies operating in Central-Eastern European (CEE) countries and in some way, this is considered a real challenge (Raszkowski & Bartniczak, 2019).

This academic paper examines disclosure on the SDGs for a sample of large companies operating in the chemical industry operating in Czech Republic,

Hungary, Poland, Romania, and Slovakia. The investigation covers the period 2015-2019. The initial sample consisted in 50 companies but we maintained only 35 firms after the refining process, adding up to a number of 114 firm-year observations (from 111 reports and 3 observations based on website only). All companies' reports and additional information were hand collected. In order to succeed in our research, the textual and content analysis was performed to study to what extent the companies describe the SDGs in their reports or on websites and to assess the general status of disclosure on the SDG topics using a score-based approach.

Although literature is rich in studies dealing with sustainable development, the majority of such studies approach a macroeconomic, country level analysis and there are none that quantify the impact on SDGs by approaching a company level, focusing on companies from the chemical sector in emerging economies from Europe. The paper has several significant contributions: it analyses the influence exerted on all SDGs, it highlights both the SDGs that benefit from substantial efforts and those SDGs which require further attention, and the paper is focused on the chemical sector, which is characterised by a high degree of complexity, and as such it interacts with a wide number of SDGs (WBCSD, 2018).

The results have indicated that 63% of the analysed reports did not specifically mention SDGs that were targeted by their efforts; this being partially explained by the fact that in 2015 the SDGs have just been set. The highest overall SDG score was obtained for SDG 8, adding up to a value of 462 out of a maximum of 875, emphasising that companies are mostly concerned about the safety and well-being of their employees. This goal is closely followed by SDG 13 with a score of 430 and SDG 12 with a score of 427, which are strongly correlated with SDG 9 and SDG 17 scoring 399, also being situated above the average. SDG 3, SDG 4, SDG 5 and SDG 7 are other goals that recorded a score above the mean. The low-scoring goals are represented by SDG 15, SDG 10 and SDG 16, located below the mean, whereas SDG 14, SDG 1 and SDG 2 are situated at the end of the range.

From the total number of 35 companies included in the sample, 12 firms (34.28%) record an average SDG score situated above the mean of 44.13. Another important finding is the extraordinary symmetry for the first and last places in SDGs completion hierarchy, but also for the distribution of companies compared to the chemical sector average. Hence, half of the analysed companies improve their SDGs implementing and reporting procedure to achieve a high level in reporting hierarchy, while the other half should manage SDGs in a better way to ensure a position at least above average.

The goals which were most reported on are SDG 12, SDG 13, and SDG 17, which were mentioned by more than 90% of the companies. Goals 4, 5, 6, 7 and 8 appeared in 80-90% of the companies, while SDG 3, 9, 10 and 15 were allocated

by 60-80% of the companies. The lowest ranks were occupied by SDG 1, SDG 14 and SDG 16 located between 37-40%, respectively SDG 2 reported only by 29% of the companies. The ranking confirms our initial expectations and it is significantly determined by the relation between the chemical sector particularities and the specificity of each SDG. These results are also consistent with our previous findings regarding the highest overall and average scores, and similar to the ones obtained by of Ionaşcu *et al.* (2020) for the real estate sector.

There were 11 companies covering almost 29% of the sample which had a single report, out of which Linde Gas AS achieved the highest score, while the others did not exceed 43. For the rest of the companies (with more than 2 reports), a few (4) recorded high and medium constant values showing their great interest related to SDGs reporting, a large number (11) reflect a growing trend, while a smaller number (6) recorded a fluctuating trend over the analysed period, or even a declining trend (4 companies).

In terms of the analysis of SDGs score by years, the interest in reporting the SDGs achievements has an increasing trend in the first years from 2015 to 2018, followed by a decrease in the last year for all the sustainable development goals. The highest value was recorded for SDG 8 with an accomplishment maximum rate of 20% in 2018, fairly close high values were obtained for 9 goals (SDG 3, SDG 4, SDG 6, SDG 7, SDG 9, SDG 11, SDG 12, SDG 13 and SDG17) and, after a significant gap, SDG 10, 14, 15, and 16 are following. The smallest values were recorded for SDGs referring to combating poverty and hunger, although the SDG 2 was set as a priority goal for the chemical sector (WBCSD, 2018).

A deeper analysis was conducted in comparison to the same WBCSD roadmap, where 10 plus 1 key goals are set for the chemical sector, the values obtained for the SDGs disclose an exact match for 8 plus 1 priority goals, meaning a compliance of almost 82%. However, significant differences were found for two of the goals – SDG 2 and SDG 14.

As chemistry is essential to the global food and aquatic waste value chain, the chemical sector companies should be more involved in actions that contribute to sustainable and healthy food supply and improving water quality by reducing pollution and protect marine and coastal ecosystems. In addition, the analysis revealed other two key goals: SDG 4 and SDG 5. The chemical sector supported the quality of education through investments and scholarships in universities, but especially through technical apprenticeships useful for potential employees to improve their professional skills. Furthermore, it is remarkable that the companies were concerned by the gender equality. The companies from the chemical sector supported the participation of women and were involved in diminishing the gender gap, also by emphasising the number of women working in executive positions.

Besides the pertinent findings, the paper has its own limitations: firstly, the hand-collecting data is time consuming and prone to biases; the inaccuracy of textual analysis is too generous to draw meaningful extrapolations about the relationships implied by data release through reports. Even though we applied joint efforts in developing the score, the researchers' subjectivity is not eliminated. As designers of this study, we confronted unstructured reports and numerous times group reports instead of individual local company reports which are not relevant for a country level analysis. UN proposes a set of 17 goals (SDG) with a total of 169 specific targets which were not separately investigated, by contrast, this research considers a general description, qualitatively and quantitatively, of each SDG.

Our further work will concentrate in expanding the database and adding financial information to recognise and examine the relationship between financial figures and non-financial data, articulated as SDGs.

Our research is relevant for the academic community contributing to the debate concerning SDGs disclosure and progress, and to broaden the theoretical writings based on content analysis of non-financial reports, as well for businesses to advance in their engagements and reporting on the topic of SDGs.

### Appendix 1. List of Sustainable Development Goals (UN, 2015)

Goal 1	End poverty in all its forms everywhere
Goal 2	End hunger, achieve food security and improved nutrition and promote sustainable agriculture
Goal 3	Ensure healthy lives and promote well-being for all at all ages
Goal 4	Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all
Goal 5	Achieve gender equality and empower all women and girls
Goal 6	Ensure the availability and sustainable management of water and sanitation for all
Goal 7	Ensure access to affordable, reliable, sustainable, and modern energy for all
Goal 8	Promote sustained, inclusive, and sustainable economic growth, full and productive employment and decent work for all
Goal 9	Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation
Goal 10	Reduce inequality within and among countries
Goal 11	Make cities and human settlements inclusive, safe, resilient and sustainable
Goal 12	Ensure sustainable consumption and production patterns
Goal 13	Take urgent action to combat climate change and its impacts*
Goal 14	Conserve and sustainably use the oceans, seas, and marine resources for sustainable development
Goal 15	Protect, restore, and promote the sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss
Goal 16	Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable, and inclusive institutions at all levels
Goal 17	Strengthen the means of implementation and revitalize the Global Partnership for Sustainable Development

### Appendix 2. Assigning score procedure

Capture from the 2017 Social impact report:

Targets to 2020	2013	2014	2015	2016	2017
Reduce greenhouse gas emissions by 15% (baseline 2012)	-4%	-8%	-14%	-23%	-32%

The score assigned to SDG 13 was 5, as the company disclosed the quantitative target (Tq), namely *reducing greenhouse gas emissions* by 15%, but also the quantitative assessment of the obtained results on the progress towards the SDG target (Mq) by mentioning the *reduction of 32%* compared to 2012.

Appendix 3. SDGs average score matrix

Company	SDG 1	SDG 2	SDG 3	SDG 4	SDG 5	SDG 6	SDG 7	SDG 8	SDG 9	SDG 10	SDG 11	SDG 12	SDG 13	SDG 14	SDG 15	SDG 16	SDG 17
